

B. ABSTRACT

1
2 The subject invention is an electronic fence adapted to warn of the undesired
3 wanderings of young children and/or the approach of undesirable individuals to include
4 means to immediately warn others in a restricted home or other area when an undesirable
5 individual approaches a restricted area; such overall structure including pluralities of
6 boundary markers with electronically based detection means, a receiver device capable of
7 receiving a plurality of radio signals, and means to display or project the activation of a
8 detection device that further indicates which detection device has been activated in order
9 that the observer can determine that a child or an individual is transgressing a given
10 boundary limit and the area where such transgression is occurring.
